

What is the clinical significance of VEGFA VEGF165b Overexpression in Colorectal Cancer with Bevacizumab in CIViC?

Understood! I will research the clinical significance of VEGFA VEGF165b overexpression in colorectal cancer in relation to bevacizumab, using CIViC data. I'll compile relevant findings to explain the implications and treatment considerations.

Worked for 2 minutes >

In CIViC, the molecular-profile **VEGFA VEGF165b overexpression** is associated with colorectal cancer and treatment with **bevacizumab**. The sole evidence item for this profile (EID9289) is based on a **predictive** preclinical study in which nude mice were injected with VEGF165b-transfected LS174T colon cancer cells. The mice were treated with bevacizumab; tumors overexpressing VEGF165b grew faster than control tumors lacking VEGF165b. The study authors concluded that VEGF165b expression **reduces sensitivity to bevacizumab** in this model [civcdb.org](#). CIViC labels the evidence type as **Predictive** with a **direction of "supports"** and a **significance of "reduced sensitivity"**, indicating that overexpression of this anti-angiogenic VEGFA isoform may predict resistance to bevacizumab therapy [civcdb.org](#). The evidence is classified at level **D (pre-clinical evidence)** [civcdb.org](#).
