

What is the clinical significance of VHL W117fs (c.349dup) in Von Hippel-Lindau Disease in CIViC?

Sure! I will look up the clinical significance of the VHL W117fs (c.349dup) variant in Von Hippel-Lindau Disease using CIViC. I'll provide you with the latest information available about this variant's clinical impact.

Worked for 2 minutes >

The VHL W117fs variant results from a c.349dup (sometimes described as TRP117LEUFS) that introduces a frameshift and premature stop codon (W117LfsX1) in the VHL tumor-suppressor protein. In CIViC the variant is classified as a rare germ-line frameshift mutation. Evidence comes from a case-study level (Level C) report where 53 patients with molecularly confirmed VHL mutations and pancreatic neuroendocrine tumours were reviewed; one patient carried the W117fs (c.349dup) variant, which was interpreted as a "PVS1" ACMG evidence code because VHL loss of function through frameshift variants is a known disease mechanism civcdb.org. CIViC describes the evidence type as *Predisposing* with direction "Supports" and lists the variant origin as "Rare Germline" civcdb.org. The clinical significance for VHL W117fs (c.349dup) in the context of Von Hippel-Lindau Disease is therefore *Predisposition* (i.e., the variant is considered to confer genetic susceptibility rather than serving as a therapeutic or diagnostic biomarker) civcdb.org.
